THE PROBLEM

THE MONTHLY CLOSE IS BUILT BY HAND.

Every commercial team at Damm UK — like every drinks company — answers two questions each month:

- How are we tracking vs. budget?
- What's the fastest way to close the gap?

Today, the answer means pulling data from five different tools, joining it in spreadsheets, and waiting on the analyst. By the time it lands, half the month is gone.

The point isn't a better forecast. It's a faster decision.

THE PRODUCT

ONE SCREEN. THREE SECTIONS.

- **Forecast** — *Where are we headed?* The model's number for next month vs. the team's target. The inputs are visible — click any to see exactly how it moves the number.
- **Playbook** — *What moved, what can we move?* A map of how every brand and channel is doing, plus a simulator for promotions.
- **AI Analyst** — *Ask anything.* A Cala-powered assistant that only answers from your data and Cala's market signals.

Bilingual English / Spanish, every screen, every answer.

FORECAST

YOUR NUMBER VS. THE MODEL'S NUMBER.

Two tiles, side by side — designed to force the conversation no spreadsheet does:

- **Your sales target.** Typed in by the team. **Starts blank.** The gap is never fake.
- **Forecasted sales.** Built from the same month last year plus how the last 12 months are trending — and adjusted for how Bedford's weather is doing vs. normal.

Bedford has been +0.6 °C warmer than usual.

*That shifts next month's number by **+139 HI.***

The kind of sentence a sales director can read out loud.

A MAP OF WHAT'S MOVING — AND A WAY TO MOVE IT.

The matrix. Every brand, channel, and top customer plotted by volume change × margin change vs. last year. Four quadrants tell the story instantly:

- **Winning Both** — protect & scale
- **Underperforming** — investigate fast
- **Margin Defence** — won volume at a cost
- **Volume Push** — gained margin, losing share

The simulator. Pick a brand and a past promo scenario. See what **adding vs. skipping** would do to volume and margin — with stated confidence (*e.g. "27 past promotions · high confidence"*).

Promo choices stop being gut calls.

POWERED BY CALA. ANSWERS ONLY FROM YOUR DATA.

The assistant in the right rail has two sources — and only two:

1. **MarketPulse's internal data** — every company number (volume, margin, promos, customers, channels).
2. **Cala's market signals** — news, competitors, retailer events, weather, regulation.

Anything outside that, it refuses:

"That's outside what I can verify from MarketPulse internal data or Cala. I'm not equipped to answer that here."

One click from the simulator hands the scenario over to the Analyst, ready to weigh the four levers — brand, channel, promo, sales effort — against your latest data and what's happening in the market.

WHY IT HOLDS UP

HONEST WHERE IT MATTERS.

- **No fake confidence band.** One projection line. We removed the $\pm 10\%$ halo because it wasn't based on real math.
- **Weather actually moves the forecast.** The Bedford temperature effect is calculated from years of past data, and applied to next month's number based on what's happening right now.
- **Every simulation shows its evidence.** Few past examples? We tell you so you don't over-trust it.
- **Refusal is a feature.** The Analyst saying *"I can't answer that"* when it can't — that's how trust gets built.
- **English and Spanish, throughout.** Every screen, every Analyst answer.

BUILT IN A WEEKEND

TWO PEOPLE. A REAL PRODUCT.

- **Next.js 16 + React 19 + TypeScript** (the modern web stack)
- **Tailwind v4** with a custom palette — **Cream · Charcoal · Crimson** (Damm-native)
- **Vercel AI SDK + Claude Sonnet 4.6** through the **Vercel AI Gateway**
- **Cala MCP** for the external market data
- Damm UK workbook loaded at build time — the app opens instantly

67 pull requests. About 36 hours of work. `main` was demo-ready every step.

WHERE THIS GOES

WHAT WE'D SHIP NEXT.

- **A real weather forecast.** Plug a Met Office feed into the model — the math is already in place.
- **More levers in the simulator.** Beyond brand, channel, and promo type — add sales-effort levers (account visits, activations, distribution).
- **Per-user target memory.** Today the target resets each session. Saving it means the cockpit starts the conversation, not the user.
- **Live data feeds.** Wire SAP, Salesforce, and retailer feeds into the same loaders the workbook uses today.

THANK YOU.
